Careers in Web Design and Development

Researching jobs that involve web design and development really opened my eyes to just how many opportunities are available. Website development is a growing field and it is so important to have people involved who are good at what they do. Online shopping, banking, grocery shopping, and so many other things are becoming very online dependent which to me seems like they no longer need buildings or as many employees as they have now. Something I learned after researching and looking at this website was just how essential some of these skills are to keep many jobs and consumer needs alive and going. Something as simple as being able to provide technical management for projects that expand website functionality and enhance the organization's digital presence is so important for the big companies online and the smaller ones too. That is the job description for a Digital Producer which is very cool to me because I have always been interested in the appeal of websites and designs in general. I learned that to be a Digital Producer I would make between $58,348 and $69,252, I would need to get a bachelor's degree in that related field, and I would need some exposure to the complex tasks within the job function with 2-4 years of experience.

Something I learned from the class is how common it will be to know how to do or fix problems if you were to go into a career that involved any type of design or website producing. I also have realized from this web fundamentals course that you should always do something thoroughly when it comes to html or css because you never know if the little things will come back and create problems. Whereas if you fixed them or did it correctly the first time, it will help you a lot later down the road.
